                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 8

JC7850
disintegrin and metalloproteinase(ADAM) 9 protein, short form - human
N;Alternate names: MCC9 protein; meltrin gamma
C;Species: Homo sapiens (man)
C;Accession: JC7850
R;Hotoda, N.; Koike, H.; Sasagawa, N.; Ishiura, S.
Biochem. Biophys. Res. Commun. 293, 800-805, 2002
A;Title: A secreted form of human ADAM9 has an alpha-secretase activity for APP.
A;Reference number: JC7850
A;Molecule type: mRNA
A;Residues: J-655 AHOT>
A;Cross-references: UNIPROT:QBNFM6; GB:AF495383
C;Comment: This protein, which is a member of the a disintegrin and metalloprotease (ADA)
Lular functions. It is proteolytically active, and has an alpha-secretase activity for a
                                                                                                                437
                                                                                                                                                                                                                                                                                                                                              616

Initial evaluation of fertilin as an immunocontraceptive antigen and molecular cloning of the cynomolgus monkey fertilin beta subunit.";

Mol. Reprod. Dev. 43:70-75(1996).

-!- FUNCTION: Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By

SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
1. SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
1. SUBCELDULAR LOCATION: Type I membrane protein.
1. TASUES PERCIFICITY: Expressed specifically in testis.
1. TASUE SPECIFICITY: Expressed specifically in testis.
1. DOMAIN: A tripeptide motif (TDE) within disintegrin-like domain could be involved in the binding (by similarity).
1. PTM: The signal and the metalloprotease domain are cleaved during the epididymal maturation of the spermatozoa (By similarity).
1. SIMILARITY: Concains I disintegrin domain.
1. SIMILARITY: Contains I EGF-like domain.

Reprod. 56:1245-1254(1997).

-1- FUNCTION: Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).

-:- SUBCELULAR LOCATION: Type I membrane protein.
-:- SUBCELULAR LOCATION: Type I membrane protein.
-:- DOMAIN: A tripeptide motif (VGE) within disintegrin-like domain could be involved in the binding to egg integrin receptor and thus could mediate sperm/egg binding we similarity).
-:- PTM: The signal and the metalloprotease domain are cleaved during the epididymal maturation of the spermatozoa (By similarity).
-:- SIMILARITY: Concains I disintegrin domain.
-:- SIMILARITY: Contains I EGF-like domain.

MOI. Reprod. Dev. 45:107-116(1996).
-1-FUNCTION: Sperm surface membrane protein that may be involved in apperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).

T "Cloning and sequence analysis of rat fertilin alpha and beta -
developmental expression, processing and immunolocalization.";

MOI. Hum. Reprod. 3:801-80(1997).

C -!- FUNCTION: Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during

fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).

SUBCELLULAR LOCATION: Type I membrane protein.

DOMAIN: A tripeptide motif (NQE) within disintegrin-like domain could be involved in the binding to egg integrin receptor and thus could mediate sperm/egg binding (By similarity).

PTM: The prodomain and the metalloprotease domain are cleaved during the epididymal maturation of the spermatozoa (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        domain; Glycoprotein; Signal; Transmembrane.

SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
SUBCELLUJAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed specifically in testis.
DOMAIN: A tripoptide motif (QDB) within disintegrin-like domain could be involved in the binding for egg integrin receptor and thus could mediate sperim/egg binding fly similarity).
PTM: The signal and the metalloprotease domain are cleaved during the epididymal maturation of the spermatozoa.
SIMILARITY: Contains 1 disintegrin domain.
SIMILARITY: Contains 1 EGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=95269891; PubMed=7750654; Wolfsberg T.G., Straight P.D., Gerena R.L., Huovila A.-P., Primakoff P., Myles D.G., White J.M., AppM, a widely distributed and developmentally regulated gene family encoding membrane proteins with a disintegrin and metalloprotease
  egg integrins and the mouse sperm homologue of PH-30 (fertilin)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
-!- SUBCELDULAR LOCATION: Type I membrane protein.
-!- SUBCELDULAR LOCATION: Type I membrane protein.
-!- TASUES SECTIFICITY: Expressed specifically in testis.
-!- DEVELOPMENTAL STAGE: Expressed specifically in testis.
-!- DOMAIN: A tripeptide motif (TDE) within disintegrin-like domain could be involved in the binding to egg integrin receptor and thus could mediate sperm/egg binding (By similarity).
-!- FTM: The signal and the metalloprotease domain are cleaved during the epididymal maturation of the spermatoza (By similarity).
-!- SIMILARITY: Contains I EGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               "A potential fusion peptide and an integrin ligand domain in a protein active in sperm-egg fusion.";
Nature 356:248-252(1992).
                                                                      "The precursor region of a protein active in sperm-egg fusion contains a metalloprotease and a disintegrin domain: structural, functional,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- FUNCTION: Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrine receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ProDom; PD000664; Disintegrin; 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              --- DOMAIN: A tripeptide motif (ECD) within disintegrin-like domain could be involved in the binding to egg integrin receptor and thus could mediate sperm/egg binding (By similarity).

--- PTM: The prodomain and the metalloprotease-like domain are cleaved during the epididymal maturation of the spermatozoa.

--- SIMILARITY: Belongs to peptidase family M12B.

--- SIMILARITY: Contains 1 GGF-like domain.

                                                                                                                                                                                                                                                                                                                                      Frayne J., Jury J.A., Barker H.L., Perry A.C.F., Jones R., Hall L., "Macaque MDC family of proteins: sequence analysis, tissue distribution and processing in the male reproductive tract."; Mol. Hum. Reprod. 4:429-437(1998).

-I- FUNCTION: Sperm surface membrane protein that may be involved in spermatogenesis and fertilization. This is a non catalytic metalloprotease-like protein (By similarity).

-I- SUBCELLULAR LOCATION: Type I membrane protein.

-I- TISSUE SPECIFICITY: Expressed predominantly in adult and
                                                                                                                                                                Macaca fascicularis (Crab eating macaque) (Cynomolgus monkey).

C.-I. FUNCTIONS: Sperm surface membrane procedun that may be involved in spermatogenesis and fertilization. This is a non catalytic metalloprotease-like protein (By similarity).

C.-I. SUBCELLULAR LOCATION: Type I membrane protein.

C.-I. SUBCELLULAR LOCATION: Type I membrane protein.

C.-I. DOMAIN: A tripeptide motif (ECD) within disintegrin-like domain.

C.-I. DOMAIN: A tripeptide motif (ECD) within disintegrin-like domain.

C.-I. PIM: The prodomain and the metalloprotease-like domain are cleaved during the epididymal maturation of the spermatozoa (By similarity).

C.-I. SIMILARITY: Contains I disintegrin domain.

C.-I. SIMILARITY: Contains I EGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. ```
Human and mouse sperm protein PH30 beta chain and related DNA - useful in contraceptive vaccines.
  Human PH30 beta chain sperm protein, having a FEE integrin binding domain, is 58.9% identical to mouse and 56.5% identical to guinea pig PH30 beta. The protein may be produced recombinantly and used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm-egg fusion
   Human PH30 beta chain sperm protein; contraceptive;
FEE integrin binding domain.

The invention comprises a method for diagnosing cancer, the method involves detecting the DNA or protein sequences of human cancer/testis (CT) antigens that are disclosed in the invention. The method of the invention is useful for detecting/diagnosing, treating and monitoring a cancer or condition characterised by the expression of a human CT antigen. The present amino acid sequence represents a human CT antigen

  The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal cancer, and may be useful in gene therapy. Sequences given in ADB755117-ADB75612 represent marker cDNA and proteins. Note: The sequence of data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

  domain, may be recombinantly produced by vector-mediated gene expression in host cells, preferably mammalian cells e.g. Chinese hamster ovary (CHO) cell culture. It may be used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of spermeng fusion. The protein is also useful for identifying small molecules that disrupt sperm-egg interaction and fertilization

WPI; 2003-184039/18. N-PSDB; ABT23217 New isolated human PMOD polypeptide and polynucleotide, useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMOD expression, e.g. cancer, AIDS, atherosclerosis and infections.

Claim 73; Page 193-194; 225pp; English.

New secreted human LP polypeptides or polynucleotides, useful for treating mammals suffering from conditions associated with aberrant levels of an LP polypeptide, e.g. cancers, osteoporosis, Paget's disease or Alzheimer's disease.

WPI; 2002-454591/48.

N-PSDB; ABK51494

The inventorial charges by an interaction acid sequence at least sequences of 48-1256 amino acids sequences, 94% identical to a sequence of 100% identical to the 28 amino acid sequences, 94% identical to a sequence of 100 acids, 96% identical to a sequence of 100 acids, or 97% identical to a sequence of 242 amino acids, all given in the specification; or a biologically active or immunogenic fragment of the isolated polymeptide. The polymeptides and polymoleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression of protein modification and maintenance of with the decreased expression of protein modification and maintenance of alternates (PMOD), such as cell proliferative diseases (e.g. cancer, atherosclerosis), autoimmune/inflammatory diseases (e.g. AIDS, cancer, altergies), neurological disorders (e.g. stroke, parkinson's disease, allergies), neurological disorders (e.g. stroke, parkinson's disease, compensated), vesicle trafficiking disorders, and infections (e.g. bacterial, viral, parasitic, protozoal). These are also confidential in assessing the effects of exogenous compounds on the expression of the fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the crayer polymericotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring or the invantion profiles. This sequence represents a human PMOD protein of the polypeptide. The invanctions, and are the invanctions. The invention relates to an isolated polypeptide comprising: any of 28 of the invention

The invention relates to isolated human polypeptides designated LP102, LP187, LP190 and LP241, and the polynucleotides encoding them. The LP C LP187, LP190 and LP241, and the polynucleotides encoding them. The LP C Polypeptide or the LP polypeptide agonist is useful for treating a mammal suffering from a disease, condition or disorder associated with aberrant cast the antibodies are useful for treating preventing or dispensing cancers, inflammatory disorders, bone diseases or cardiovascular diseases. In particular, the LP102 polypeptides, polynucleotides or antibodies are useful for disquasing, preventing or treating male reproductive system diseases, osteoporosis, pager's disease. These are also useful as contraceptive agents. The LP187 polypeptides, polynucleotides or reating contraceptive agents. The LP187 polypeptides, polynucleotides or antibodies are national rate baylo polypeptides, polynucleotides or antibodies are conditions. The LP190 polypeptides, polynucleotides or antibodies are useful for disquases and diseases related to coagulation or sepsis. LP241 polypeptides, and diseases related to coagulation or sepsis. LP241 polypeptides, or disbettes are the LP190 polymetodies are as useful especially for ciasquosing, preventing or treating skeletal muscle dystrophy, breast cancer or disbettes. The LP190 polymetodies are also useful for constructing DNA vectors that may be employed in medicine, or for preparing the proteins. Claim 8; Page 131-134; 148pp; English.

```
The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polypeptides canced human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, rectal tumour or cancer, colon cancer, breast tumour, proteste tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the release of tumour proliferation of normal human dermal cor stimulating the release of tumour proliferation of normal human dermal cor stimulating the release of tumour mecrosis factor-alpha from human blood, for stimulating the release of tumour proliferation of normal human dermal consists and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU831913 represent human PRO

  The present invention relates to novel human GENSET coding sequences (ACC51060-ACC51115) and proteins (ABR40453-ABR40508). The GENSET sequences are useful for preparing a composition for treating GENSET-related disorders. They can also be used as markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on Southern gels, as chromosome markers or tags to
   The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovaccular, endothelial or angiogenic disorder in a mammal, e.g. cardiox hypertrophy, trauma, cancer, agerestence in a mammal degeneration, atherosclerosis, hypertension, arterial restence is, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
  Gaps

   The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or display the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO

Tourestion and interfaces."

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002)

-1- FUNCTION: Sperm surface membrane protein that may be involved in sperm-e9g plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with e9g membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the e9g. This is a non catalytic metalloprotease-like protein.

-1- SUBCELLULAR LOCATION: Type I membrane protein.
  G0:0005887; C:integral to plasma membrane; TAS.

Holland M.K.;

Mol. Reprod. Dev. 45:107-116(1996).

-I FUNCTION: Sperm surface membrane protein that may be involved in apperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between ite disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).

   SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed specifically in testis.
TISSUE SPECIFICITY: Expressed specifically in testis.

TISSUE Atripaptide motif (TDE) within dishitegrin-like domain bowain: A tripaptide motif (TDE) within dishitegrin-like domain could be involved in the binding to egg integrin receptor and thus could mediate sperm/egg binding (By similarity).

FTM: The signal and the metalloprotesse domain are cleaved during the epididymal maturation of the spermatozoa (By similarity).
SIMILARITY: Belongs to peptidase family MI2B.
SIMILARITY: Contains I dishitegrin domain.
SIMILARITY: Contains 1 EGF-like domain.
   complex.";
Biol. Reprod. 56:1245-1254(1997).

Biol. Reprod. 56:1245-1254(1997).

Function: Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during fertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By similarity).
                           Waters S.I., White J.M.; "Biochemical and molecular characterization of bovine fertilin alpha and beta (ADAM 1 and ADAM 2): a candidate sperm-egg binding/fusion
